

SUBJECT INDEX TO VOLUME 1

Artificial neural network (ANNs)	226	role in hit identification	5
dynamical approaches to	226	role in lead identification/optimization	5
Bayesian analysis	161	role of classifier-based algorithms	4
modern computational approximations	162	role of clustering algorithms	192
Bioinformatics	161	role of network/pathway reconstruction	8
real Bayesian revolution in pattern recognition		role of target identification/validation	4
for	161	sequence alignment in	187
Biological information integration	85	Computational models	263
at systems level	85	of transcription control	263
engineering approaches toward	85	probabilistic models of	268
engineering project management for	89	Computational techniques	15
engineering system representations for	87	in prediction of functionally important regions	
Biology	235	from sequence	16
HTML in	236	in prediction of functionally important regions	
metadata in	237	from structure	19
ontologies in	239	to find conserved regions	16
XML in	236,237	to find disordered regions	18
Bio-ontologies	240	to find family-dependent conserved regions	17
gene ontology as	240	to find protein interaction sites	18
open biological ontologies (OBO) as	240	Drug discovery	3
phenotype/trait ontology (PATO) as	242	from single-target to network drugs	3
traditional approaches to	242	role in hit identification	5
Cis-regulatory elements	321	role in lead identification/optimization	5
biological discovery of	325	role of classifier-based algorithms	4
computational discovery of	326	role of network/pathway reconstruction	8
discovering modules of	329	role of target identification/validation	4
discovery of	321	Engineering process	86
roles in regulation of gene expression	322	as media for efficient computation	89
COG database	291	as media for human communication	89
in comparative/functional genomics	291	as ontology commitments	88
Comparative genomics	291	as surrogates	88
COGnitor in	293	as theories of intelligent reasoning	88
extended phylogenetic patterns search (EPPS)		Gene expression	55,264
in	293	abstraction of	264
findings inferred from COG data in	295	biclustering of	68
fusion DB in	294	classifier design methods for	59
gene context tool in	294	clustering methods applied to	66
phylogenetic COG ranking (PCOGR) in	294	estimating classifier of	65
phylogenetic patterns search in	293	prediction error of	65
role of COG data mining software	293	profile classification of	55
services combining several methods in	295	Gene networks	231,264
Complex traits	360	continuous models of	267
approaches to genetics of	360	dynamics of.....	231
Computational analyses	131	logical models of	265
of ancient polyploidy	131	transcription control in	264
of paleopolyploid genomes	132	Genetic dissection	359
Computational biology	3,185	of complex traits <i>in silico</i>	359
database searching in	190	of SAS	361
from single-target to network drugs	3	Genomes	148
multiple sequence alignment in	189	annotation of	148
pairwise sequence alignment in	187		

computational prediction of	15	Rice proteome database	34
functionally important regions in	15	RNA secondary structure	115
Protein-coding genes	209	energy functions/comparative approaches to	124
methods to detect selective constraints in	209	exact algorithms for	118
Protein evolution	207	heuristic algorithms for	122
adaptive evolution of	213	maximum weight matching for	122
methods to detect co-evolution between amino		PKNOTS for	121
acid sites in	211	prediction of	116
neutral theory of molecular evolution of	207	role of iterated loop matching	123
role of computational/statistical methods	207	tree adjoining grammar for	119
Protein interaction networks	201	Semantic networks	273
Protein-protein interaction	197	applications of	277
databases for	198	integration of biological data with	273
high-throughput technologies of	198	semantic web in	278
mining activities of	199	theory/features of	274
mining of	197	Single linkage clustering	248
predicting <i>in silico</i>	199	Systems biology	315
using PPI datasets to predict	199	combinatorial explosion in	319
Protein-protein interaction (PPI) datasets	197	mass action kinetics models in	315
use to localize proteins/predict their function	202	particle-based stochastic simulation in	315
Protein sequence clustering	247	population based modeling in	315
alternative splicing in	248	spatial resolution in	318
biological basics of	248	stochastic kinetics models in	316
domain combination in	248	TATA box	337
gene duplication in	248	in promoters of human genes	337
large scale based	247	statistical analysis of	
pseudogenes in	247	Thermostable proteins	26
role of databases/methods	250	comparison with mesostable proteins	26
Protein structures	75	Transcription	321
array representations of	78	binding sites of	323
backbone representations of	81	core promoter in	322
comparison of SSE arrangements of	80	Transcriptional networks	301
rapid methods for comparing	75	by mining omics data	301
scanning databases of	75	Two-dimensional electrophoretic gels	255
secondary assignments of	78	as biostatistical means for comparing proteomic	
secondary elements of	78	data	260
SSE approximations of	80	averaging gels in	258
string representation of	76	background subtraction in	258
Protein thermostability	25	benchmarking in	260
algorithms/theory of	26	choosing/modifying reference gel in	259
computational predictions of	25	digitizing gel images by	256
electrostatics in	29	image analysis in	256
hydrophobicity in	30	in proteomic experiments	255
interactions of	29	software analysis of	255
role of molecular dynamics (MD)	28	spot detection in	257
theoretical analysis of	25	spot matching in	259
Pseudoknots	115		
hardness of prediction of complex type	125		
RNA secondary structure prediction with	115
